ORGAN DONATION

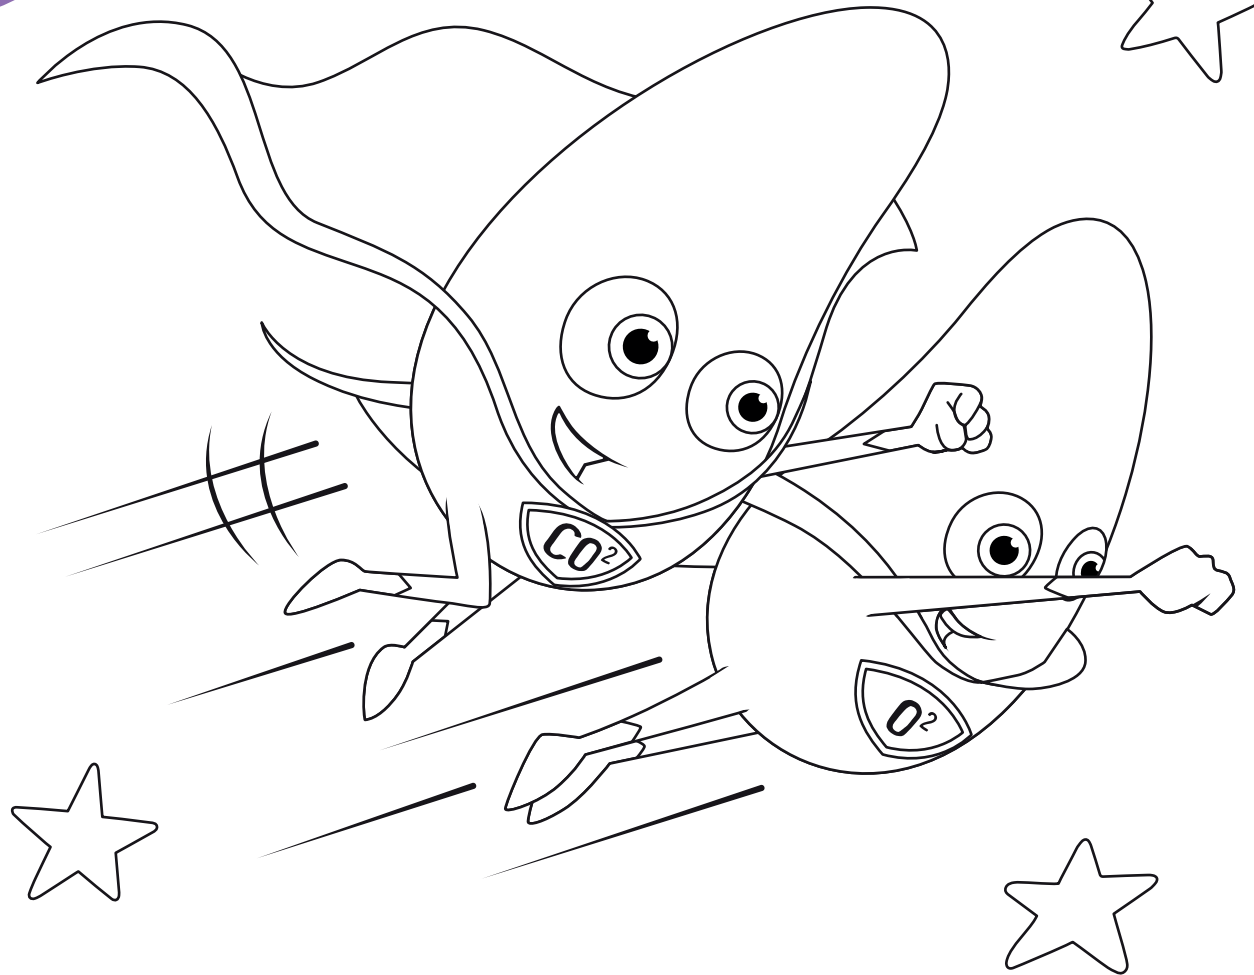

London Celebrates Organ Donation Week 7-13 September 2020

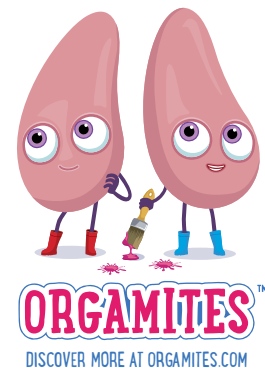

LUNGS

These organs always stick together. They transport oxygen from the air you breathe into your bloodstream and take away carbon dioxide when you breathe out.

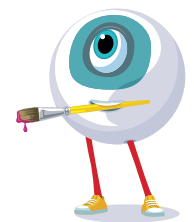

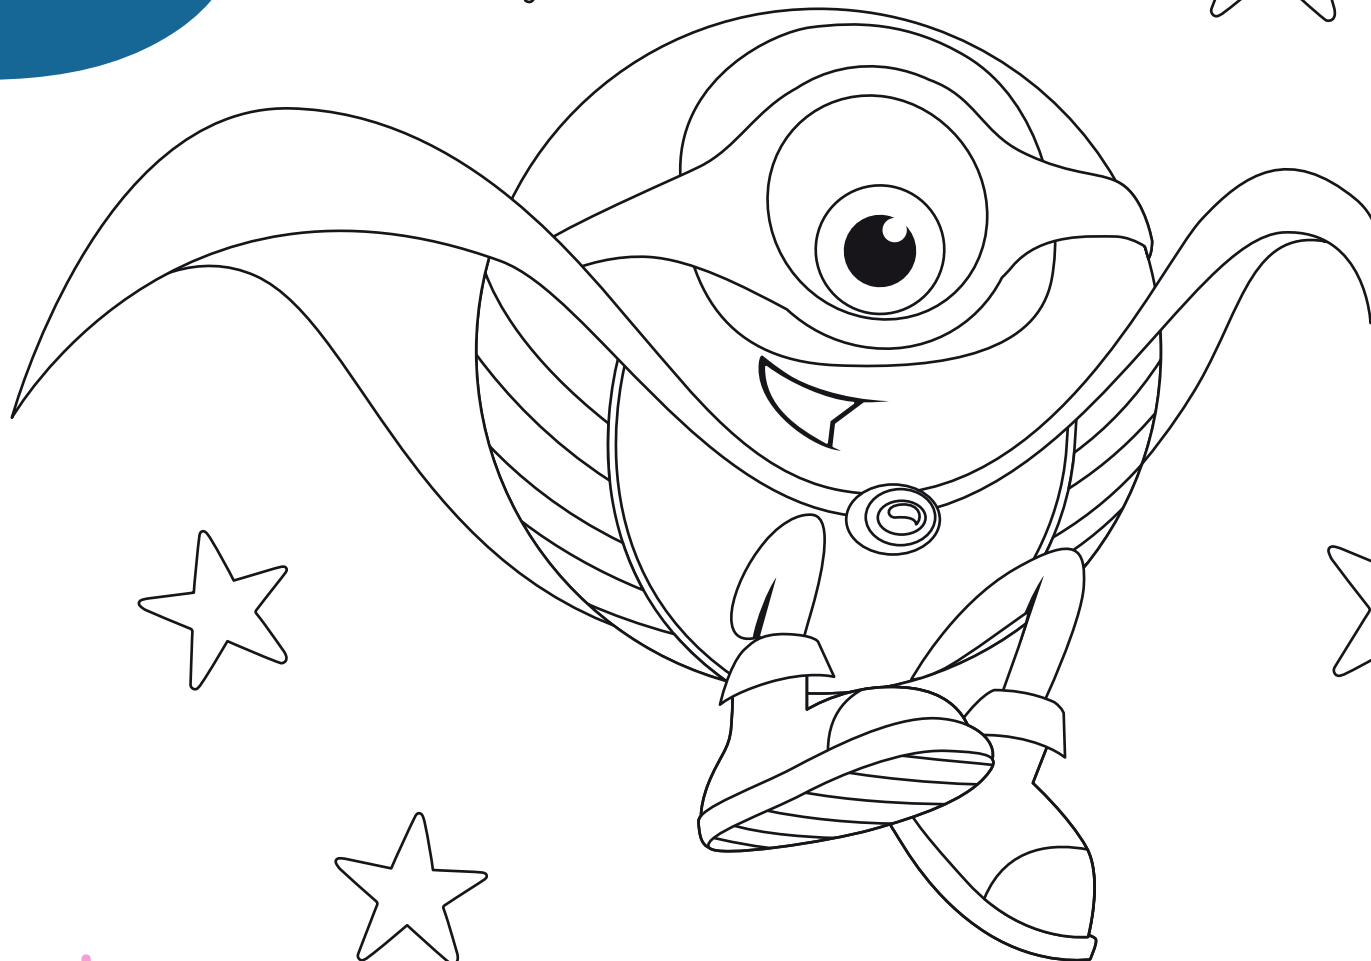

Yes I donate
ORGAN DONATION

EYE

This observant ball-shaped organ lets in light and sends messages to your brain which allow you to see.

PANCREAS

A little quieter than the others,
this organ makes two important
substances - enzymes to break
down food and hormones to
control blood sugar levels.

KIDNEY

Most people have two of these bean-shaped organs. They focus on cleaning and their most important job is filtering waste products from your blood.

CAPTAIN MARROW

Captain Marrow isn't an organ
he's a bone. The captain has an
important function - holding the
team together and making blood
cells for your body.

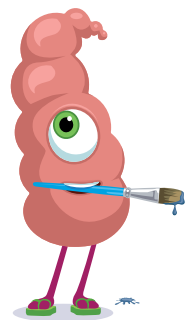

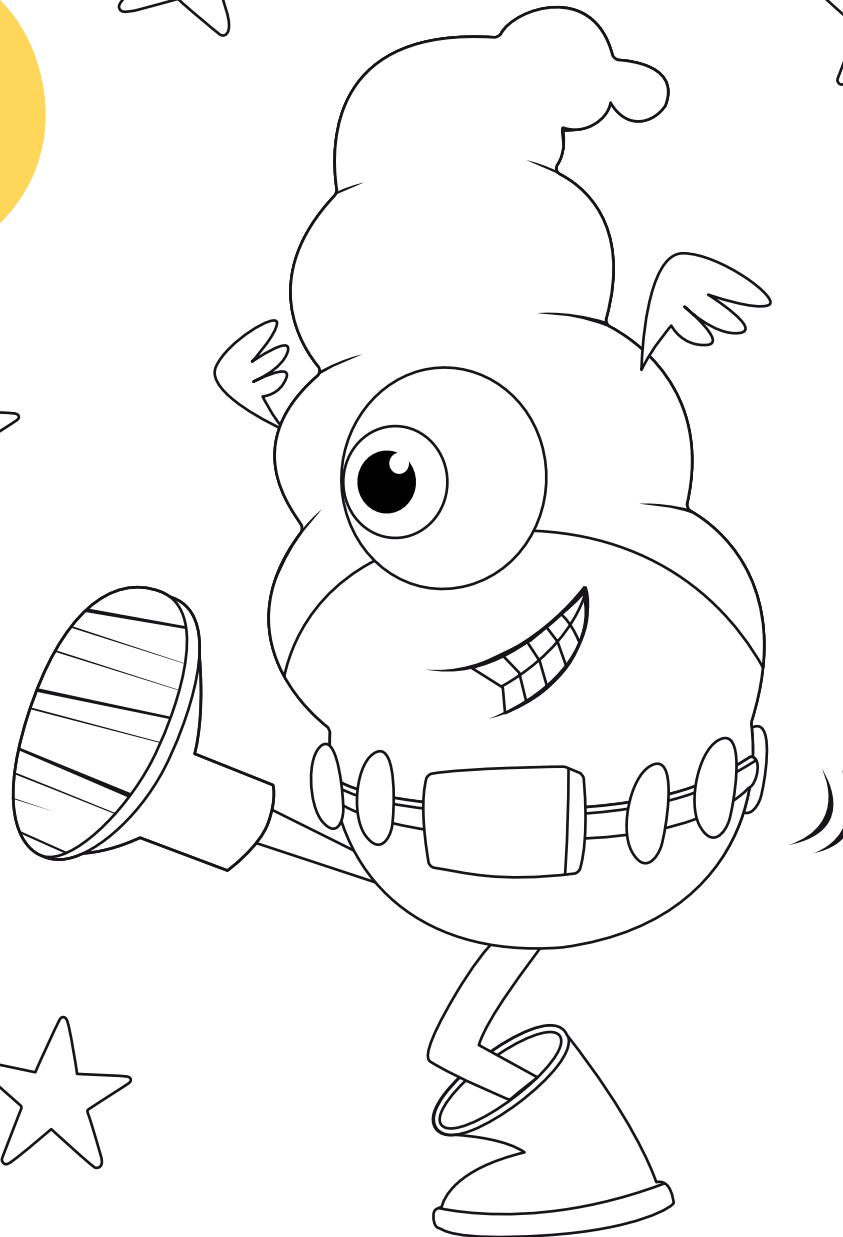

IT'S WHAT'S
INSIDE THAT
COUNTS

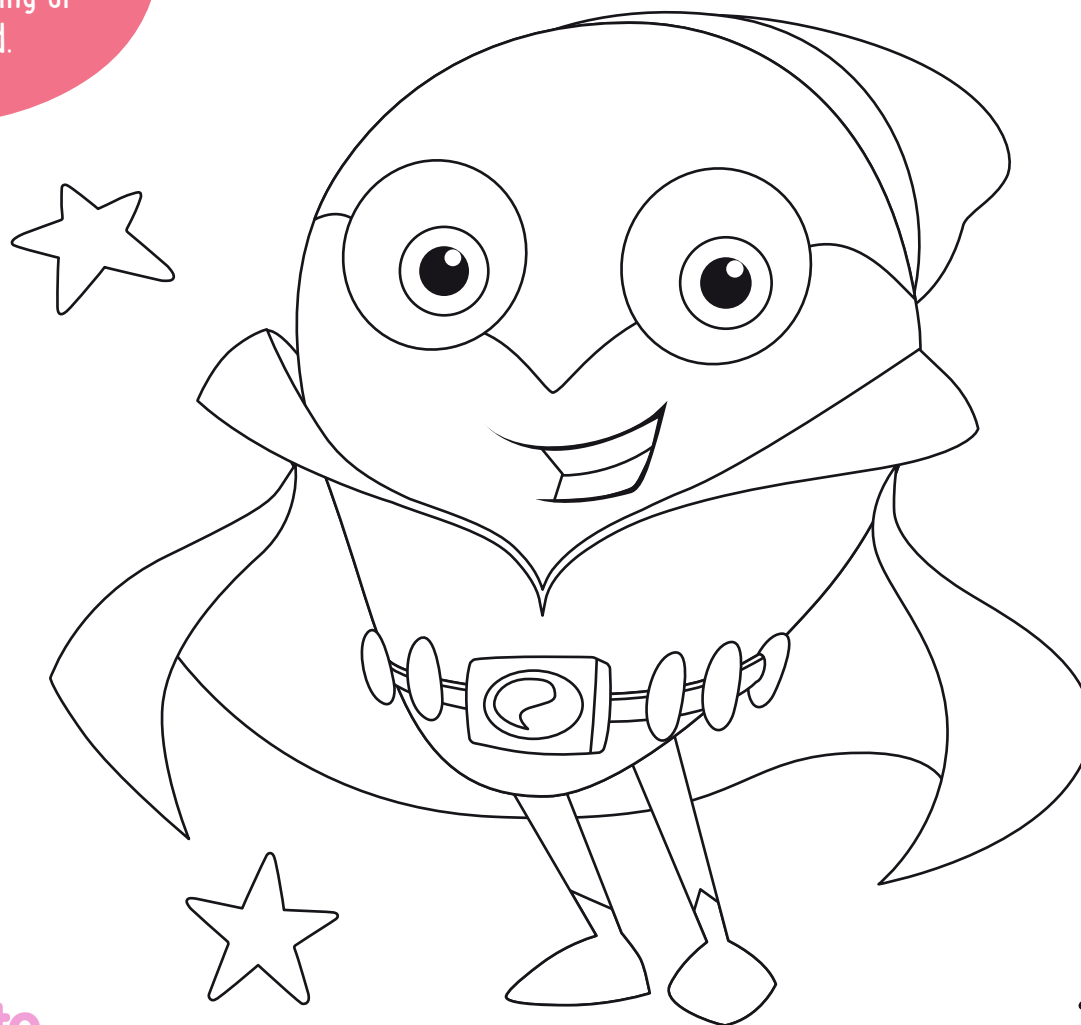

SMALL BOWEL

Also called Small Intestine:
Small but long, this organ measures roughly 6m end to end! It's always thinking about food and absorbs the nutrients from what you eat and drink.

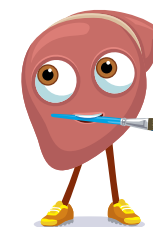

LIVER

Always busy, this organ has more than 200 different functions! Most importantly, cleaning or filtering your blood.

HEART

This organ does everything
with a steady rhythm -
a powerful pump to move
blood around your body.
